Fashion & Textiles
What are Textiles?

A type of material composed of natural or synthetic fibers.

A type of cloth.

Textiles are often associated with the production of clothing.

Textiles are everywhere
Defining the Problem of Textile Waste

We are a Consumption Hub

64 new items per year, 1.2 garments per week
Canadian Apparel Import/Export Patterns

CANADIAN APPAREL BALANCE OF TRADE
Millions of Dollars

Mass Consumption is slowing, not ending

Material Flow of Garment Production

Textile Industry

Apparel Industry

Distribution Channels

Pre-consumer textile waste from 1,483+ manufacturing facilities
Material Flow of Garment Production

82 pounds of textile waste per person per year
85.75% Disposed Textile Material

- Organic fibre production
  - Cotton
  - Flax
  - Wool
  - Silk
  - Cellulosic

- Synthetic fibre production
  - Polyester
  - Nylon
  - Acrylic
  - Elastane

83% of the world fibre demand: cotton & polyester

Water use
Land use

Chemical use

Energy use

- biodegrade
  - releases methane
  - toxic, acid leachate

- do not biodegrade; decay times similar to plastic
15% Collected Textile Material

Reuse
6.75% mainly reused as second-hand clothes

Recycle
4.5% recycled and converted
3% recycled into new fibres

0.75% sorted out for landfill
Textiles can be Recycled in 2 ways:

1. Mechanical
   - Ragging
   - Shredding

2. Chemical
   - **Synthetic fibres**: Material can be melted and respun into high quality synthetic fibres at low energy cost
   - **Organic fibres**: Significant technological progress has been made in recent years to recycle cotton fibres into cellulosic fibres.
   - Technical challenges remain, mainly the recycling of cotton and polyester and other fibre blends.
1. Canada is the seventh largest exporter of used clothing in the world, with exports topping $185 million annually to places like Kenya, Angola, Tanzania and India.

2. Canada is also importing used clothing. Imports from the U.S. reached $104 million in 2013 alone. Canada is by far its biggest customer in terms of used clothes, outpacing even Chile ($61 million) and Guatemala ($55 million).
We Need to Get More Textiles Out of Landfill

Why do so many textiles end up in landfill?

Online survey, data were collected in February 2015, in collaboration with survey provider SSI

410 valid surveys

- a sufficient sample size for Ontario
- gender and age distribution reflects a representative sample

Photo taken by William Baird
Donation is a Social Norm

- Clothing donations are not dependent on gender or age.
- Nearly 92% of the participants of the study know where to donate their garments, and estimated that they donate nearly 60% of all their garments!
- However, this number drops down to 50% donations when participants get confronted with different clothes and have to make “real life” decisions about what to do with the garment.
People Don’t Know What To Donate

• Participants donate clothes for reuse not for recycling!
• Textiles, such as towels or bedsheets are often forgotten.
• 49% of the participants throw their clothes away because they think they are in such a bad condition that nobody could wear them anymore.
Communication

- Here’s a picture of recycling bins placed outside the University of Boras, Sweden
Donation is Dependent on Convenience & Accessibility of Donation Boxes

• Convenience plays a big role in whether people will donate.
• 34% name accessibility as the main barrier to donation.
• Only 42% of the participants know at least one spot that is very convenient to reach.

Clothing Drop Boxes, Toronto, ON

Further Factors Influencing Donation Participation:

• **Volume influences behaviour:** People are more likely to dispose of garments in the waste when the volume is low.

When people dispose:

• Nearly 28% stated they that they get rid of their clothing whenever they noticed them.
• Nearly 27% of people keep their clothes for a spring and fall clean-up.
• 22% clean out their closets when there’s no more room.
Disposal is Widespread

• 9% of the participants admit to dispose everything!

Why do we need to worry about this?

  • 13,500,000 residents in Ontario
  • 37.2 kg of textile waste each person per year

We estimated that Ontario alone produces more than 500,000 tonnes of *residential textile* per year.
Industrial Textile Waste

The not so low hanging fruit
Thank you
